

## Argument Solved! There are Benefits to Green Energy

Fossil fuels have long been crucial to American society. We use fossil fuels to heat our homes, run our cars, and create our electricity. America's appetite for fossil fuels is increasing dramatically. Consequences of our fossil fuel habit is depleting our resources and killing the planet.

Green energy sources are not a cure but they will help. Green energy sources offer many advantages. Advantages that we will not get without changing our habits. Some argue that green energy is too hard to generate. True as that might be, there are many different types of green energy sources. We just have to identify those that are viable, according to geographic location.

The various green energy sources such as solar, wind, wave, hydropower and geothermal do not produce anything harmful which may have a negative effect on the environment. This is the exact opposite of what you get when you continue to operate a coal or nuclear power plant.

Fossil fuels produce carbon dioxide as a by-product. Individual coal plants do not put off much carbon dioxide. Until you consider, there are 50,000 coal plants around the world. It is estimated that this number will only increase. If we do not reverse this trend, we may not have a world.

Many say nuclear power is a reliable solution. No one disputes that nuclear power does produce a large amount of energy. The dispute is whether or not we are effectively and safely disposing of the spent nuclear rods. We also have to consider nuclear accidents such as Chernobyl and Three Mile Island. These incidents were many years ago. We have gotten better at containment; however, it only takes one accident.

Green energy also requires maintenance. Windmills have mechanical parts that must be maintained. Corn to make ethanol must be grown. Biomass fuels require the trash to be separated and sorted. All of these choices are more attractive than fossil fuels. Green energy utilizes facilities that are cheaper to operate.

The next advantage of using green energy sources is that we will never run out of them. For centuries, the Sun's rays have reached so has the wind which is blown from the sea. By using it, we decrease our dependence on oil which is a nonrenewable resource.

Governments are only talking about replacing fossil fuels. They hold global climate change summits. They pass resolutions. They even tell us that we need to drive less and reduce our energy usage. Without viable alternatives, it is difficult to do. It is time that we realize we have viable alternatives. We have green energy.

Awareness does not always mean change. Daily we are told that global climate change is here. People are told what they should do. Yet, not even the government is building wind mills or erecting solar panels. Who will lead by example?

Green energy is a viable alternative to fossil fuels. While there are maintenance costs, green energy is renewable. We are past due for action, rather than talk. You have the power in your hands. It is possible to have home made energy. You just have to decide whether you want to commit or continue to spew toxins into the environment.
