

Biofuels will change everything

Biofuel is actually made from biological material. That means that it is renewable. Fossil fuels aren't renewable, and that's why we should all lean towards using biofuels. Fossil fuels are slowly disappearing, because of the large usage that is present today in the world. Now, we are practically depending on the fossil fuels. Imagine if they would just be gone now... everything would be lost. People don't realize it, but everything is based on fossil fuels today. That's why so much effort is put into biofuels research.

Of course, biofuels are very friendly for the environment around us, unlike fossil fuels. Fossil fuels release too much CO₂ into the atmosphere, and therefore make the air polluted. Biofuels, on the other hand, don't do such things. They are very good for the environment and for the atmosphere.

Probably the most popular type of biofuel is biodiesel, which already in use. Apart from biodiesel, there are many types of [biofuels](#) around. There is, for example, algae fuel, alcohol fuel, biogas, bioheat and many more. They are different because they are all derived from different sources, and all are renewable, which is amazing!

Of course, if you are looking to go green, one of the main parts of doing that is to start using biofuels, or at least supporting them. Going green means much more, but one of the things is that you should be into using renewable energy, because that is the future. Biofuels are supported by many organizations, and it should be also by you.
