

Well Water Filter

A well water filter is a must have addition to your home if your drinking water source is a well. Since a well works by gathering water from a groundsource there is always a chance that some unsavoury substances have made their way into your water.

The quality of our naturally occurring sources of water is rapidly occurring. All kinds of harmful chemicals from both industry and farming are having a devastating effect on our water. The remains of these products are not breaking up i.e. not bio-degradeable and are seeping down to the water table.

The water table from which we draw via our wells is constantly being polluted by a wide variety of contaminants. Whether it is run off from modern farming practices or industrial waste our previously healthy water table is being constantly damaged.

If a well is the primary source of water for your household you really should consider using a well filter. This is especially true if you live in an area with industry nearby or intensive farming. A filter will get rid of organic wastes, sediments and many chemicals, including lead, as well as odours. So much of our well water is now contaminated that fitting a filter is probably the only way we can be sure of its purity.

The majority of households will avail of point-of-use filters. These filters are applied to taps around the house. Many people choose to use a sink water filter as an alternative.

The sink filter is a cartridge attached to the sink tap. It works by purifying the water as it passes through it on the way to the tap. These options are also often used with shower heads and are great for making the water softer and thus easier to foam.

The best answer overall is the fitting of the complete well water filtration system. This is a very simple and cheap method. One filter is attached to the main water carrying pipe from well to house. It purifies the water prior to it even entering the house, it also means that filters do not have to be attached to each tap.

This is a very handy option as there is only the single cartridge to be replaced.

Well filtration systems will give you all the pure water you need. Be aware though that reverse osmosis outfits are not a good idea. Reverse osmosis also takes out all the good minerals in your water. You might get clean water but it will have lost a lot of its goodness.
