

Home Made Energy Kits

This is a great time to build your own home made energy system. The sun is out lot of photons and wind for you to catch and turn into cash for free. More cash for her to shop with and you come out looking like a hero!

Why invest in a home made energy kit now? I mean gas prices are down. Well now you have extra cash so put it to work for you. The best time to invest is when prices are low.

A lot of us just got money back from our income tax. I used this money last year to buy my own home made energy kit. This helped me do well while gas prices were going through the roof. Although gas is down we all know they will be going up.

Thousands of people are cutting or completely eliminating there electric bills right now. Some are going the extra mile, they have bought electric cars and charge them on their home made energy systems.

Yes a lot of electricity is made from coal but as you know the price of gas affects everything. The coal has to get to the plant somehow. I am tired of my cash flow being attacked at the whim of the electric company or foreign oil suppliers.

What do you need to build a home made energy system?

*Building a home made energy system is extremely simple. I built mine in a weekend.

*All you need to build your home made energy system can be found at your local hardware store. Some of these things include dc motor, plywood, photovoltaic cells, and glass. You will also need basic hand tools and elbow grease.

*A contractor will do all this for you. For around \$30,000 is the price they gave me to get me off the grid. To me this did not make sense it would take me a life time for the system to pay for itself. I needed something cheap that would pay off sooner. How about you?

About the Author

* Confused on where to start don't worry there are hundreds of manuals online, don't buy any manuals until you read this review on [Home Made Energy Kit](#) * Garry Fisher an average Joe has written a candid review on [Home Made Energy Kit](#) read this before you buy a manual.
