

Myths about Hybrid Cars

If you are thinking about a hybrid car, you may be hearing quite a bit of "gossip". Some people think the hybrid car is the best thing on the market. Other people say it'll just pass. Yet other people again say they think they can save a lot of money, but you're not sure it's really worth it. What's the truth, and how do you separate myth from fact with all of the stuff that is being thrown at you? Below, you can read and consider the usual hybrid vehicle myths.

Hybrid cars are just the same as electric cars: This is untrue because hybrid vehicles are fuel-powered for the most part. However they have what are called 'battery assists'. The assist is powered by a nickel-metal hydride battery pack that is rechargeable.

You are guaranteed to save money with a hybrid car: If you are doing town motoring, you may save gas and you may not. The same goes for highway driving. There are just many different factors. It has been said that if everyone bought hybrid cars, the gas consumption would drop by only 10%. That's not a very big difference.

A hybrid car's battery can run flat: A hybrid car battery should not run out while you are actually driving it. The engine of a hybrid vehicle does not idle when stopped (at a red light for example). What does it do instead? Well, it is recharging its battery. So, there is no need to worry about a hybrid vehicle stopping for that reason.

A hybrid vehicle's rechargeable battery lasts only for 2 years: A hybrid car certainly would not be worth buying if this was true. A hybrid car's rechargeable batteries usually come with an eight-year guaranty.

If I run out of fuel, I can keep driving on the hybrid car battery: Bear in mind that, a hybrid's battery is an assist. That means that hybrid vehicles still run on gas. After you run out of fuel, the battery could keep the car running for a little while. However, the vehicle will cease running very soon.

Hybrid cars will soon put normal car dealers out of business: This probably won't happen very soon. The reason for the delay has to do with the how much hybrids cost. Most people just can't afford one. Also, people just aren't certain whether they will actually save money on a hybrid car. Therefore, they are loathe to join the rush of people who want to buy a hybrid vehicle.

Hybrid cars will only save you about 88USD per annum: I did hear something on the news the other day, but it may be untrue. If there's something you really want and there's a lot of gossip surrounding it, you simply have got to start digging around and do of your own research. There are many different types of hybrid car, and many different manufacturers make them. This means that there may be much more involved than we have discussed here. A hybrid car may help you, and it may not, but the final decision is up to you.

Therefore, please don't worry a great deal about what people tell you. They probably have only listened to others passing on rumours Do your own due diligence and make up your own mind. Try the Internet to get your information. The manufacturer's literature is also rather useful, if you stick to reading the facts and gloss over the gloss. Check that what the literature claims is also in the warranty.
